Par 209.

Memorandum for Draftsman.

On the South Western Part of Sheet II where Misham Δ was not recovered some trouble was at first experienced in determining signals accurately, and some of the lines at first run which are now correctly plotted did not cover the desired area. By extending Sheet I going into the interior and cutting back, the signals as now plotted on that portion of the sheet are relatively correct, although shrinkage of paper may have changed the scale slightly. On this Sheet II the position of Round Hill Δ was changed slightly to make it relatively correct with the rest of the signals on the sheet. Tracings taken from the sheets of one of the shore parties before their sea-son work commenced did not cover the SW'N section of the "Cape" sheet exactly, but as now transmitted all the signals are absolutely correct with reference to each other, and if the scale is slightly changed, it is so small that it could not be taken into consideration practically.

2

In plotting soundings at the beginning of the Season's work, it will be well to bear in mind that when the launches were used they did not have their proper headway at first, and that they often had not been turned completely when the line was started. As soon as I noticed this it was corrected by taking a second angle after the boat was fairly underway.

The signals as plotted on the smooth projections are absolutely correct, (relatively) on the working sheets however they were frequently wrong owing to the sheets getting damp and even wet. They were of course corrected from time to time and as often as possible.

In broken uneven rocky bottom such as is found in the Approaches to New Bedford, it is exceedingly difficult to do the work thoroughly on a scale of 10.000 and the work is done so closely that it will be very difficult to plot the soundings. I recognized this but can not see how it could have been avoided. Now that the work is completed many of these extra lines

14

developed nothing, but without running them this fact would not have been established, and it is my opinion that we have missed nothing that we should have found.

For greater convenience in plotting refer to the Table giving Rocks, Shoals etc in this report.

Par. 209. (1)

Sheet No 7.

New Bedford Harbor, Clark Cove and Saganaram
Harbor.

Sheet No 8

Ashuelot River.

Sheet No 11

Approaches to New Bedford Harbor.

The table of statistics required by the Instructions
(Pages 56, 57 and 58) is transmitted rolled up in the
sheets as directed.

Descriptive Report.

Paragraph 209 (2) (3) (4) (5) (6) ---, (8) ---, ---, (11) (12) ---,
 (14) ---, ---, (17)

The information asked for is already contained in the Sailing Directions and it would lengthen this report unnecessarily to repeat it here.

U. S. Coast Pilot Part III and Atlantic Coast Pilot Division D, Boston to New York contain nearly all the information required.

It seems to me that the Approaches to New Bedford should be regarded as including all the waters East of Mischaum Point and East of West Island.

On page 205 Atlantic Coast Pilot Division D, there is an erroneous statement. It should read after the italicised words "Inner and Outer Harbor." - the former comprising all that portion inside of Palmer's Island, and the latter embracing all that part North of Clark's Point and outside of Palmer's Island. To one in this vicinity regards the Approaches

among the ledges as a desirable anchorage.

In the same volume the statement that 11 feet can be carried above the bridge (meaning the first or lower bridge) at mean low water requires correction. The barge "Loye Star" drawing 20.2 feet frequently discharges her cargo above the bridge, and while she goes up at high water a statement that 16 feet can be carried above the bridge at mean low water would be more accurate.

In a harbor like New Bedford information at high water is all that the larger vessels are interested in.

The largest cargoes are brought here by the following vessels.

Barque James D. Elwell	21.3 ft	1812 tons.
Schooner H. W. Macouabee	20.4 "	1572 "
" Marjorie	20.6 "	2052½ "
" Mary E. H. Dow	20.6 "	1834 "
" Viking	20.6 "	1632 "
" John D. Manning	20.6 "	1666 "
" H. K. Pack	20.8 "	1800 "
" Gen. S. E. Mervin	20.3 "	1395 "
" H. S. Little	20.6 "	1744 "

7

Schooner	B. A. Van Brunt	20.3 ft	1793 tons.
"	K. D. Perry	21.3 "	1727 "
"	C. L. Davenport	20.8 "	1640 "
"	Marjorie Brown	20.3 "	1840 "
"	W. J. Sipeett	20.0 "	1555 "
"	P. F. Soole	20.6 "	1797 "
"	Dagamore.	19.6 "	2300 "

There is a ^{2nd}

^{ad} drawbridge known as the Coggeshall Street Bridge about $1\frac{1}{2}$ statute miles above the first bridge. This draw is near the middle of the bridge but slightly nearer the Eastern end. It permits vessels drawing 14 feet to pass through. There is however no one permanently stationed to open this draw, and the Board of Public Works must be notified if a vessel wishes to go above this bridge.

"Landmarks and Ranges."

With reference to the Paragraph on Ranges
 (Page 9). I would state that the most prominent
 Land mark in Buzzards Bay is the Stand pipe
 in Fairhaven.

The next important in the Approaches to New Bedford,
 is the old Light tower at Clark's Point.

This Landmark, is extensively used in the day time
 and should be at once placed on the Charts and kept
 there while there is anything of it remaining.

"Ranges"

The following are ranges which will carry vessels clear of everything to the depths shown on the charts.

1st The White Beacon NE of Potters Flat, known as Egg Island Beacon on with the Standpipe at Fairhaven will carry a vessel clear until she arrives in the vicinity of the gasbuoy.

2nd The old light tower at Clark's Point on with the Fairhaven Standpipe can be seen a long ways off and by getting on this range and standing in a vessel will find herself between Black buoy No 7, and the Sandspit buoy, as these buoys are sometimes hard to see, especially the Spar buoy No 7, this range is extensively used.

The range of Egg Island Beacon on with Fort Beacon is already given in Division B page 206.

The old light tower at Clark's Point on with the tower of Rodgers School which is a Coast Survey A is the range used by the tugs in bringing in the deepest draft vessels. It closely corresponds with the edge

of the red sector of Clark's Point Light, at night.

The range given in the Sailing Directions after passing the gas buoy is correctly described, but the tugs after passing the buoy about a quarter of a mile haul in to the N. $\frac{1}{2}$ a hundred yards or more and then steer for the black buoy No. 11 marking the eleven foot spot afterwards following the buoys. They do this to avoidumps on the ~~the~~ edge of the channel.

Paragraph 209 - (9)

The prevailing wind is S.W. During the summer months it blows almost continuously often with the force of a moderate gale. At night it nearly always dies away.

The only dangerous gales in the harbor are South Easters, when the sea heaves in through the opening. At such times the bottom is so disturbed that the anchors are apt to drag, while under normal conditions the holding ground is excellent wherever the chart shows mud bottom.

Paragraph 209, (10)

A wreck was located on Great Ledge. It will probably remain there a long time. Least depth over it at mean low water is 2.0 feet.

Paragraph 209 (13)

"Descriptive Report."

Wharves and data relating to them.

All data with reference to wharves will be found in a separate book, 2nd Cutter (yellow) for convenience of reference at all times in the future.

The wharves are numbered on the Sheet 1, 2, 3, 4, etc.

In the wharf book this number is always referred to, but in addition the owners names are given.

For still greater ease of reference the following Table is submitted. Any information desired can thus be easily obtained.

Sheet No	No of Owners	Boat Day Position	Depths at end of wharf	Depths alongside of wharf
No 1 Wharf				
1	Namsutta Mills Corporation Cutter	a 42-43	wharf	West to East -2.5, +5.5, 10.5, 9.5 ft

Paragraph 509 (15)

No hydrographic office. Ch to Ice code.

Paragraph 509 (16)

There are three Marine Railways in New Bedford Harbor located as follows.

1. - Abram Chase & Co. Fairhaven. Depth over sill forward 10 ft aft 14 ft. Capable of taking out a vessel of 900 tons. Length of Cradle 150 ft. It is proposed to lengthen this Cradle 30 ft making it 180 ft.
2. Granite Wharf Marine Stock Co. Fairhaven. Depth over sill forward 9 ft aft 12 ft. Capable of taking out a vessel of 600 tons. Length of Cradle 120 ft.
3. A. Bealkey. Fish Island, New Bedford. Depth over sill forward 10 ft aft 14 ft. Capable of taking out a vessel of 200 tons. Length of Cradle 45 ft.

Dec 209 (7)

Rocky, Shoals etc.

17

Few persons would notice the remark on Chart 350 about the plane of reference and that it is not Mean Low Water. I call attention to this as the Chart shows nearly a foot (.8 of a foot) less water than it would had the plane been as usual, mean Low water.

For convenience of reference the data with reference to rocks and shoals has been tabulated, all new information is indicated in red, all that is old in black.

As a recognition of the zeal and close attention to duty displayed by Mr. J. M. D. Doctor of this Party who was indefatigable in his search for sunken dangers and rocks, I would respectfully recommend that the ledge of 38 sunken rocks off Sather's Point first determined by him be called Doctor Rocks, especially as they have no local name, and their existence did not seem to be known to anyone.

An inspection of the annexed tables will show many discrepancies between the depths shown on the Chart and those

actually developed by the survey and I would most respectfully urge that in placing rocks reported by outside parties on charts, that a record be kept so that the weight which may be given to such reports may be judged by officers sent to examine or re-survey such localities.

We wasted an immense amount of time in trying to find the depths marked on the chart, and the examination was in all cases thorough. In many cases the rocks could be plainly seen, this of course disposed of any chance of our being mistaken.

Taking into consideration the fact that Chart 350 shows depths .8 of a foot below mean low water, an inspection of the Tables will show the results of our work at a glance.

The rocks formerly given on the chart were visited and revisited, always located, dragged over and least depths diligently searched for. Examination in all cases was thorough.

Keel Rock on the Chart, it is impossible to locate, the whole vicinity is full of rocks, some with less water, some with more than shown on Keel Rock so called on the Chart.

The rock known to the inhabitants in the vicinity as Keel Rock is another rock altogether, one that is bare at low water, the one given in the table Launch 23 of ⁸² Sheet 2.

The great number of new shoals found are of more or less importance. Most of these will be useful only to sail boats and small yachts, but as these latter always use our Charts they will no doubt appreciate the great number of changes in the new chart.

Paragraph 209 (7)

An inspection of the following Table will show all information with reference to rocks and shoals developed by the Survey at a glance. New information in red. Old information in black.

Sheet	Locality	Dist from Lay Line	Dist from Chart	Dist water depth on chart	Dist water depth actually found at M.L.W.	Remarks.
I	1075 metres S from Lec C 22	i	24		✓ 3.14 ft

Specimens.

While for purposes of Navigation specimens of the bottom in our work may be of very little value, still for scientific purposes they may be of use and sixty six specimens were obtained well distributed over the work outside of Palmer's Island. Twenty four of these specimens were obtained on Sheet I and forty two on Sheet II. They are forwarded in the bottles provided for that purpose and labeled. A complete record of these will be found in the Specimen books one for each sheet.

Currents.

A spar buoy off Clark's Point afforded a fine opportunity to get the difference of time between high and low water and the change of flood and ebb currents had there been any current to speak of at this Point, but the buoy nearly always rode to the wind when there was any.

There is so little current in both the Inner and Outer Harbors that vessels at anchor, always ride to the wind if it blows with the force of a light breeze.

For this reason no special effort was made to obtain current data.

It is not practicable to anchor the Launches, in the open bay for forty eight hours. The Schooner could be used but as it is only at the far limit of our work where any currents are encountered the steamers which will hereafter join on to our work can readily determine such current data as may be required.

Tides.

The work in connection with tidal data was placed under the charge of Ensign W. A. Edgar, at the beginning of the season. On Oct. 15, Ensign Edgar became Executive Officer, and the tidal work was assigned to Ensign J. F. Hubbard, by whom all data herein submitted was prepared.

Tide Gauges.

On May 27, 1895, a tide gauge was established on the sheltered side of the stone pier at Clark Pt. Six other gauges (staff) were established, as the work advanced, and careful comparisons were made with the standard (Clark Pt.) The comparisons show that the tides of the Harbor and approaches are of a simple form. The gauges established in addition to the one at Clark Pt. are:-

Upper Padanaram gauge, situated near Stern's boating wharf, and used for soundings in the upper harbor (above bridge.) Bench marks given in separate report.

Lower Padanaram gauge, situated near the coal wharf, below the bridge - used only for comparison. Bench marks later.

Nonguitt gauge, situated near Ricketson's wharf in Nonguitt - used only for comparison. Bench marks later.

Philadelphia & Reading Coal Wharf gauge, situated in the southern slip of the coal company, back of the office - used for soundings between Palmer Id. and Fairhaven bridge. Bench marks later.

Wamsutter Mills Wharf gauge, situated on north side of mill wharf - used for soundings between the Fairhaven & Coggeshall St. bridges.

Belleville gauge, situated half way between the Coggeshall St. bridge and head of river, on that side, south of a ruined wharf,* near signal Stump. Used for soundings above the Coggeshall St. bridge. * Public landing of New Bedford owned by city.

There is an automatic tide gauge in the inner harbor, owned by the city & under the charge of the City Engineer. During the past season, its mechanism was out of order, and its results have not been considered in working up the data. Mr. Williams, the City Engineer has been most obliging, and should the Office desire additional data, he would furnish it with pleasure. As these observations will continue for a period of years, the results obtained may prove of great value.

In 1903 Asst. R. G. Faris leveled between B. m.s. at Clark Point. The results are shown in the following table:

	1875 ft.	1903 ft.
B. M. 1 - B. M. 2	0.69	1.51
B. M. 3 - B. M. 1	2.20	2.09
B. M. 3 - B. M. 2	2.89	3.60

It appears that Lieut Howe was quite rough in his measurements, for the later ones were made with care. L. P. S. Aug. 1, 1905.

Comparison of Gauges.

Clark Pt.	Mean low water reading (determined from one lunation, May 29-June 27, 1895)	2.0 ft.
Upper Padanarame	" " " (determined by comparison Aug. 15-17, 1895)	1.0 "
Lower Padanarame	" " "	5.9 "
Nonquitt	" " "	3.0 "
Phil. + Reading Coal Wharf	" " "	4.0 "
Nansutta Mills Wharf	" " "	1.8 "
Belleville	" " "	1.9 "

Bench Marks.

Clark Point:- No. 1. 1st seam under lower tier of embrasures, on N.W. face of fort under the center of western gun-post and corresponds to reading 5.61 ft.

No. 2. Center of the (6th) sixth flagging stone on west side of the stone pier from the top of the stone steps. Marked by a cut on the edge of the stone, and corresponds to reading 6.3 ft.

No. 3. Center of the edge of the port side of the eastern lower gun-post on the N.W. face of fort. Corresponds to reading of 3.41 ft.

Bench marks 1 and 2 are about $\frac{1}{6}$ mile distant from each other.

Upper Padanarame:-

Bench mark No. 1. on wharf post about gauge. Marked... and corresponds to reading of 5 ft.

No. 2 is on a rock 20 ft. east of gauge. Marked with + cut in rock, and corresponds to reading 5 ft.

Lower Padanarame:-

Bench mark No. 1 is on wharf spike to which gauge is nailed. Marked with 5 copper nails (.) and corresponds to reading 10 ft.

No. 2. is a cross (+) cut on rock alongside gauge and corresponds to reading 10 ft.

Nonquitt:-

Bench mark No. 1. is 9 copper nails... on wharf spike alongside gauge, and corresponds to reading 8 ft.

No. 2. is a cross (+) cut on rock 31 ft. south of gauge, and corresponds to a reading of 8 ft.

Bench Marks.

Phil. + Reading Coal Wharf:-

Bench mark No. 1 is the letter E and two holes, thus (E..) six feet west of tide gauge on stone wharf and the lower line of the E corresponds to a reading of 8.1 ft. No. 2 is a cross and two holes, thus (+---) 2ft. 8in. west of gauge on stone pier. Center of cross corresponds to a gauge reading of 5.2 ft. No. 3 is 3 large iron nails driven in first spike east of gauge. Center nail corresponds to a gauge reading of 7 (seam) feet.

Namsutta Mills Wharf:-

Bench mark No. 1 is directly alongside gauge on wharf spike and consists of 3 copper tacks, corresponding to reading of 6 ft. No. 2 is a cross and two holes (thus +-) cut in stone wharf 4ft. 3in below top of wharf, abreast gauge. Center of cross corresponds to gauge reading of 5 ft.

Belleville:-

Bench mark is a hole in rock of stone pier of public landing. There are two smaller holes above the bench mark thus: (:-) The lower hole corresponds to reading 5 ft.

Establishment of Port.

From observations during one lunation (CLARK Pt.)

56 441-55-

Estab. of Port. 7-53 56

Note:-

C. S. Chart No. 350 gives 74 49m

"Bouditch" gives 76 57m

Tidal Data.

(For chart - Art. 99 "Instructions for Hydrographic Parties".)

The plane of reference is Mean Low Water, which reads on staff	2 ft.
Average time of High Water after moon's meridian passage	7 ^h 53 ^m ²⁷ ₅₆
Average time of Low Water	1 ^h 04 ^m ⁴⁹ ₅₈
Average height of High Water above the plane of reference	3.5 ft.

Additional data:-

Rise of Spring tides above plane of reference	3.8 ft.
Rise of highest observed tide above plane of reference	5.0 ft.
Fall of Spring tides below plane of reference	1.8 ft.
Fall of lowest observed tide below plane of reference	1.5 ft.
Mean duration of High Water stand	52 m.
Mean duration of Low Water stand	1 ^h 09 ^m
Mean duration of Rise	6 ^h 48 ^m ³⁴ ₅₆
Mean duration of Fall	5 ^h 38 ^m
Mean range of tide [Mean Rise + Fall]	3.5 ft.
Spring range - - - [Spring - " - " -]	4.6 ft.
Neap range - - - [Neap - " - " -]	2.8 ft.

Unusual tides on separate page (No. 6.)

The above table was obtained principally from the observations during a lunation - May 29 - June 27, 1895, when weather was favorable and tides apparently characteristic, throughout. Observations of high & low water were also made during 36 days, and have been used when advisable.

The following report of the highest tide known in the Harbor is a copy of one forwarded the vessel by Mr. W. F. Williams, City Engineer, in answer to a request for any data in regard to ~~very~~^{unusual} high tides. There seems no doubt that this is the highest tide known.

The city plane of reference (M.H.W.) is (.7) seven-tenths of a foot above our M.H.W. or is 4.2 ft. above our plane of reference - M.L.W. (Determined by a comparison of city gauge records with standard gauge readings at Clark Pt. (J.T.H.)

High Tide of Feb. 8, 1895.

Moon full and in perigee Feb. 9th. Almanac predicted medium tide.

Tide reached maximum height - at about 6:30 a.m. on the 8th.

Along the wharves the tide reached a point 4.2 ft. above datum (M.H.W.).

At Boggeshall St. Bridge it rose to 4.4 ft. above M.H.W.

The railroad track was covered along the wharves.

Barometer 7 am. 28.76

Thermometer 7 am. 16°

Wind " S.W. 30 miles an hour

Snowing - began at 9 p.m. evening before.

The harbor was full of ice and on this account there was no sea and the rise was very uniform.

High Tide of Dec. 31, 1895.

Accompanying this report is a blue print, furnished by Mr. Williams, New Bedford City-Engineer, showing the tide of Dec. 31, 1895 as recorded on the city's automatic gauge.

Statistics of Field Work executed by *Hydrographic party of Lieut. G. C. Hanes, U.S.N.*
U. S. Schooner Eager.

Date and place of beginning field work *May 21, 1895, New Bedford, Mass.*

Date and place of closing field work *December 21, 1895—New Bedford, Mass.*

N.Y. TIMES of Thursday, Sept. 4, 1902, has a headline "Brooklyn Strikes Rock in Buzzard's Bay". For a couple of weeks prior to this date there had been combined navy and army manoeuvres along the New England Coast, and as far south as New York. The Brooklyn was the flagship of one of the attacking squadrons. Pertinent sections of text of article in TIMES follow:

"New Bedford, Sept. 3.—The United States cruiser Brooklyn, flagship of Rear Admiral Coghlan in the make-believe war now being waged off the New England coast, ran upon a real obstruction in Buzzards Bay at 12.36 P.M., immediately after the completion of a theoretical attack on Fort Rodman, which guards New Bedford. The extent of the injury inflicted upon the cruiser is not as yet known, but it is reported that the "finest" flooring of her magazines are buckled", which expression is manifestly erroneous. It is said that she is making but little water and that divers are being set to work at once, to ascertain the extent of the damage.

* * *

(text relating to attack on Fort Rodman prior to accident)

"The Brooklyn led a section of Admiral Higginson's invading fleet* * * was going a nine-knot speed when she encountered the obstruction, which was uncharted, but which is believed to be an ancient wreck."

* * * - - -

In the same column in the TIMES is quoted the following despatch from the New Bedford correspondent of the New Yorker Staats-Zeitung:

"After attacking Fort Rodman this morning, the Brooklyn struck a rock in 6 fathoms of water. Two of her plates and frame were bent in and seams between two compartments were opened slightly, but the cruiser made little water. One small pump was sufficient to control it. At no time was there any danger, and the damage was not considered serious at all.

* * *

"At time of the accident four of the officers were on the bridge with the Admiral himself. They had taken bearings, knowing that the cruiser was in rocky waters, and were congratulating each other that they had passed, according to the chart, all danger of hitting a rock, when the crash came. The other ships were signaled to keep away from the dangerous spot, and steps were taken to mark the spot where the hidden rock is located.

New York TIMES of Sept. 5th, 1902, had a despatch from Washington, in part as follows:

Admiral Coghlan gives technical details of damages in a despatch to Navy Dept. One phrase: "Do not consider blame attaches to any person concerned."

Comment from Washington TIMES correspondent stated that the cost of repairs would probably total upward of \$50,000. to take from 3 weeks to two months at the Brooklyn Navy Yard.

"The bay in which the Brooklyn struck was charted, not by the Navy Hydrographic Office, but by the Coast and Geodetic Survey. The Brooklyn is believed to be the biggest vessel which ever entered Buzzards Bay. It was realized that an element of risk attended her appearance in that locality, but naval officers point out that the manoeuvres are intended to simulate actual war conditions and produce beneficial results in the way of valuable information to the army and navy.

Apparently repairs were ~~now~~ not considered as immediately needed, since the name of the Brooklyn appears in some items about the war games in the Narragansett Bay area in the TIMES of Sept. 6th. There was a long editorial in the TIMES of Sept. 9th which has no reference to the Brooklyn accident.

The Brooklyn had been Admiral Schley's flagship in the war with Spain.

The Brooklyn had been Admiral Schley's flagship in the war with Spain.

N.Y. TIMES of Thursday, Sept. 4, 1902, has a headline "Brooklyn Strikes Rock in Buzzard's Bay". For a couple of weeks prior to this date there had been combined navy and army manœuvres along the New England Coast, and as far south as New York. The Brooklyn was the flagship of one of the attacking squadrons. Pertinent sections of text of article in TIMES follow:

"New Bedford, Sept. 3.--The United States cruiser Brooklyn, flagship of Rear Admiral Coghlan in the make-believe war now being waged off the New England coast, ran upon a real obstruction in Buzzards Bay at 12.36 P.M., immediately after the completion of a theoretical attack on Fort Rodman, which guards New Bedford. The extent of the injury inflicted upon the cruiser is not as yet known, but it is reported that the "~~finning~~ flooring of her magazines are buckled", which expression is manifestly erroneous. It is said that she is making but little water and that divers are being set to work at once, to ascertain the extent of the damage.

* * * *

(text relating to attack on Fort Rodman prior to accident)

"The Brooklyn led a section of Admiral Higginson's invading fleet" * * * was going a nine-knot speed when she encountered the obstruction, which was uncharted, but which is believed to be an ancient wreck."

In the same column in the TIMES is quoted the following despatch from the New Bedford correspondent of the New Yorker Staats-Zeitung:

"After attacking Fort Rodman at New Bedford this morning, the Brooklyn struck a rock in 6 fathoms of water. Two of her plates and frame were bent in and seams between two compartments were opened slightly, but the cruiser made little water. One small pump was sufficient to control it. At no time was there any danger, and the damage was not considered serious at all.

* * *

"At time of the accident four of the officers were on the bridge with the Admiral himself. They had taken bearings, knowing that the cruiser was in rocky waters, and were congratulating each other that they had passed, according to the chart, all danger of hitting a rock, when the crash came. The other ships were signaled to keep away from the dangerous spot, and steps were taken to mark the spot where the hidden rock is located.

From C & G S Annual Report for 1903, page 42;

Account of the summer's work by SS BLAKE, hydrographic surveys of Nantucket Shoals, Mass.:

"****" was nearly completed on September 20 (1902), when the ship proceeded to New Bedford, Mass., for the purpose of finding, locating and developing the rock upon which the U.S.A.S. Brooklyn had recently struck in the approaches to New Bedford Harbor.

The search for this rock afforded an excellent opportunity for testing the efficiency of a new channel sweep or drag recently devised and constructed at the Coast and Geodetic Survey Office. Assistant D.H. Wainwright reported on board to superintend the installation and use of the drag in making search for the rock mentioned above and its use in other tests of the apparatus. The details of the construction of this drag are given in an appendix to the Report of the Superintendent, and details in regard to its use are given in the statement of work executed by Assistant Wainwright. After the Brooklyn rock was found the region about it was closely developed by sounding from a steam launch, and afterwards lines were run over it with the drag set at various depths in order to ascertain the minimum depth of water over it. This work was completed on September 26, and Assistant Wainwright left the ship on that date. The development of certain localities in the approaches to New Bedford Harbor and in Buzzards Bay was begun on Sept. 29, and continued until October 3. Eight localities were examined, the drag being used in all cases, set to clear the minimum depth indicated by the latest chart of the locality under examination. This work served to test the efficiency of the drag, and proved its practicability and usefulness in close hydrographic development work. //
